Data are provided on the biogeochemistry of more than 60 elements and, by case history examples, their roles discussed in assisting in the discovery of concealed mineral deposits. A look to the future includes the potential role of bacteria to provide new focus for mineral exploration.

**Biogeochemistry in Mineral Exploration**  
Cycles of reduction and oxidation—i.e., the flow of electrons in metabolism—control Earth's biogeochemistry (Chapter 8.02). Recognizing that past life has affected the chemical characteristics and mineral deposits of sedimentary rocks, the science of geomicrobiology grew as an early subdiscipline of biogeochemistry (Chapter 8.04).
