Combinations vs Permutations. We throw around the term ...

This is a combination problem: combining 2 items out of 3 and is written as follows: $n C r = n! / [(n - r)! r!]$ The number of combinations is equal to the number of permutations divided by $r!$ to eliminates those counted more than once because the order is not important. Example 7: Calculate $3 C 2$ $5 C 5$ Solution:

We can use permutations and combinations to help us answer more complex probability questions. Example 1. A 4 digit PIN is selected. What is the probability that there are no repeated digits? There are 10 possible values for each digit of the PIN (namely: 0, 1, 2, 3, 4, 5, 6, 7, 8, 9), so there are $10 \times 10 \times 10 \times 10 = 10^4 = 10000$ total possible PINs.

Probability: Mastering Permutations And Combinations: Duo ...

Finally, for combination, order no longer matters, but for permutations, we took into consideration of which letter goes where. Since order does not matter, some permutations actually refer to a unique combination. That's why we divide by $10!$ from the number of permutations to get the number of combinations.
